AI-READY WEBSITES

Workshop summary, implementation checklist and Claude Code audit prompt

Purpose

A practical, implementation-focused summary of the workshop transcript and the supplied checklist screenshot. It is organized to help assess and improve business websites with Claude.

Source scope

This document summarizes the website and AI-readiness workshop. The transcript later transitions into a separate Speed to Lead workshop; that unrelated section is excluded.

THE CENTRAL IDEA

Websites are no longer used only by humans. A modern business website should be understandable, discoverable and usable by people, search engines, AI search systems, external agents and people using AI assistants.

This is a strategy summary, not a guarantee of improved rankings or AI recommendations. The workshop presents an approach and hypotheses that should be implemented carefully and measured.

1. The main idea

The workshop argues that websites should be prepared for five types of readers:

- **Humans:** People who visit and interact with the website.
- **Search engines:** Google and other search engines that crawl, understand and rank pages.
- **AI search engines:** ChatGPT, Gemini, Claude and other AI systems researching businesses and answering questions.
- **External agents:** Automated systems that access websites, gather information and potentially perform actions.
- **Hybrid users:** People using AI assistants to navigate websites and complete tasks.

Core principle: Do not sacrifice the human experience to optimize for AI. Humans and AI systems should have access to consistent, accurate information.

2. The six layers of website optimization

Layer	Focus	Meaning
A	Human Web	Website experience for humans and accessible information for bots.
B	Discovery	SEO foundations: metadata, sitemap and structured data.
C	Know Your Market	Understand customers, competitors, offers and positioning.
D	Be Evidence	Support business claims with verifiable facts.
E	Agent Actions	Allow AI agents to interact with website functionality where useful.
F	The AI Front Door	Give AI systems structured context about the business and market.

3. Layer A — Human Web

The website should remain accessible to both people and machines. The workshop highlights:

- Important business information should exist in HTML.
- Do not hide essential information behind JavaScript interactions.
- Keep content consistent for humans and AI.
- Make important information accessible without complicated interactions.
- Do not create separate, contradictory versions of the website for humans and AI.

The speaker notes that AI systems often access HTML and structured information rather than interacting visually with a website like a human.

4. Layer B — Discovery

Before creating additional AI-focused pages, establish that the website is discoverable. The workshop emphasizes:

- Page titles and meta descriptions.
- Canonical URLs.
- XML sitemap and robots.txt.
- Valid Schema.org structured data.
- Service, pricing and FAQ information.
- Relevant internal links.
- SEO, AEO and GEO foundations.

Important distinction: Adding an AI page or MCP server does not automatically improve Google rankings. The speaker suggests possible indirect benefits through better usability and easier customer interactions, but these are not guaranteed.

5. Layer C — Know Your Market

The workshop recommends researching approximately 5–10 relevant competitors. The goal is to understand how businesses serve different audiences, not simply to identify who charges the most.

Research field	What to investigate
Business	Name and website.
Services	What the business actually offers.
Pricing	Prices and pricing models.
Audience	Who the business serves.
Offers	How services are packaged.
Location	Areas covered.
Languages	Languages supported.
Booking	Phone, form, WhatsApp or online booking.
Sources	URL supporting each finding.
Verification	Date the information was checked.

Example: three painting contractors may focus on premium interiors, affordable residential work, or commercial projects and builders. The most expensive option is not automatically the best; the businesses serve different customers and provide different offers.

6. Layer D — Be Evidence

Replace unsupported marketing claims with verifiable information. Instead of saying “we are the best painters in Newcastle,” provide facts that allow people and AI systems to evaluate the business.

- Years of experience, if verified.
- Actual completed projects.
- Verified customer reviews.
- Services and qualifications.
- Warranty information.
- Business locations and service areas.
- Clear descriptions of work performed.
- Links to sources supporting important claims.

The speaker connects this approach with Google's E-E-A-T principles: Experience, Expertise, Authoritativeness and Trustworthiness.

Principle: Give AI and humans facts so they can reach their own conclusions. Do not simply tell them that the business is the best.

7. Layer E — Agent Actions

This layer is about allowing AI agents to interact with website functionality. The workshop discusses three technologies:

Technology	Purpose
API endpoints	Allow external applications and agents to retrieve information or perform specific actions.

Technology	Purpose
MCP server	Provides AI agents with a standardized way to discover and use tools exposed by a website.
WebMCP	Allows compatible browser-based agents to discover and interact with website functionality.

Potential actions include checking service availability, retrieving pricing, checking booking options, submitting booking requests and retrieving business information.

Security: Having an MCP server for developers does not automatically mean website visitors can access the same functionality. Define authentication, authorization and permissions. One customer must never be able to access another customer's private information.

These technologies are not mandatory for every website. A simple business website without interactive functionality may not need them.

8. Layer F — The AI Front Door

This is the central subject of the workshop. The speaker recommends creating a dedicated, public page that gives AI systems a clear understanding of the business, for example: **/ai**.

The page is not intended to be a traditional marketing landing page. It is a structured source of accurate business information.

Section	Information to include
Identity	Official business name and identity.
Business description	What the business does.
Audience	Who the business is best suited for.
Services	Services and descriptions.
Locations	Areas served.
Pricing	Current pricing or pricing models.
Offers	Available packages and offers.
Evidence	Reviews, warranties, qualifications and verifiable facts.
Booking	How customers can contact or book.
Documentation	Links to relevant pages and resources.
Verification	Last reviewed or updated date.

The page should be publicly accessible and consistent with the rest of the website. The speaker recommends keeping it simple, readable and information-focused rather than spending excessive time designing it.

9. The comparison page — /compare

The workshop also recommends a separate comparison page when useful. It should present factual market research comparing the business with relevant competitors.

Category	Your business	Competitor A	Competitor B
Services	Verified	Verified	Verified
Pricing	Verified	Verified	Verified
Audience	Verified	Verified	Verified
Locations	Verified	Verified	Verified
Booking method	Verified	Verified	Verified
Source	URL	URL	URL
Last verified	Date	Date	Date

Avoid unsupported claims, competitor attacks or misleading language. Do not use statements such as “we are better,” “they are overpriced,” or “their service is inferior.” Present factual differences and let readers draw their own conclusions.

Comparison page vs FAQ: An FAQ answers customer questions. A comparison page compares actual businesses.

10. The /developers page is different

Page	Purpose
/ai	Explain the business to AI systems.
/compare	Provide factual competitor comparisons.
/developers	Explain how developers and agents can use website functionality.

A developer page can document API endpoints, MCP server, WebMCP functionality, available tools, authentication, parameters, permissions and API documentation such as Swagger. If the website has no APIs or MCP functionality, do not invent them just to create this page.

11. Screenshot checklist — extracted

The supplied screenshot presents six categories and their checklist items:

Category	Checklist items
A — Human Web	Key facts in HTML; public footer link to /ai; same content for bots and humans.
B — Discovery	Titles, canonicals, sitemap; valid Schema.org; /pricing, /faq, /compare.
C — Know Your Market	Ask AI about customers' queries; map 5–10 competitors; every cell sourced and dated.
D — Be Evidence	Fit statement: best for whom; facts side by side, Unknown = No; no “better than X” claims.
E — Agent Actions	Read-only tools first; authentication + confirmation for bookings; WebMCP feature detected.
F — The AI Front Door	/ai live, crawlable, dated; identity, offers, pricing, proof; one link to /developers.

12. Claude implementation workflow

The speaker recommends a research-first workflow rather than immediately asking an AI agent to modify the website.

- **Audit:** Check what already exists, what is missing and what needs improvement.
- **Research:** Identify competitors, customer queries, offers, pricing and service differences.
- **Plan:** Determine which pages, information and technical functionality are necessary.
- **Review:** Read and answer Claude's questions. Verify its research and decisions.
- **Approve:** Only after reviewing the plan should Claude modify the website.
- **Verify:** Check factual accuracy, existing functionality, links, metadata, crawlability and consistency.

The speaker describes several iterations with the AI agent, rather than relying on one large prompt. The human should apply judgment and not blindly accept every recommendation.

13. Implementation safeguards

- Never create contradictory information between the AI page and the main website.
- Never fabricate reviews, qualifications, pricing or competitor information.
- Every competitor comparison should have a source and verification date.
- Do not make unsupported superiority claims.
- Do not use hidden instructions or prompt injection to manipulate AI recommendations.
- Do not interfere with existing APIs, MCP implementations or authentication.
- Prioritize read-only tools before introducing actions that modify data.
- Require authentication and confirmation for sensitive actions such as bookings.
- Update information regularly, especially pricing, services and competitor data.
- Do not promise immediate AI visibility or ranking improvements.

The workshop acknowledges that AI discovery results and timelines are uncertain. It recommends testing and monitoring rather than promising specific outcomes.

14. Practical implementation priorities

A reusable workflow can be applied across multiple websites, but first establish what already exists and what genuinely needs to be built.

Priority	Task	Expected output
1	Existing SEO audit	Technical and content issues.
2	Business information audit	Verified business facts.
3	Customer research	Customer questions and search intent.
4	Competitor research	5–10 competitor comparison.
5	Evidence collection	Reviews, warranties, qualifications and proof.
6	AI Front Door	/ai page.
7	Comparison page	/compare page.
8	Developer documentation	/developers, if relevant.
9	Agent functionality	APIs/MCP/WebMCP, where justified.
10	Ongoing verification	Updated information and monitoring.

Recommended approach

Do not implement all ten priorities simultaneously. First establish what already exists, then address the most important gaps. The difficult part is not creating the /ai and /compare pages; it is getting the information right and keeping it updated.

15. Claude implementation prompt

Copy the following prompt into a new Claude Code session for the website you want to audit. It instructs Claude to research and plan first, without changing code.

```
# Website AI Readiness & Market Positioning Audit

I want to improve this website based on the AI-ready website strategy outlined below.

The objective is to make the website understandable, discoverable and usable by five types of readers:
1. Humans
2. Search engines
3. AI search engines (ChatGPT, Gemini, Claude, etc.)
4. External AI agents
5. Humans using AI assistants to interact with websites

## Phase 1 — Existing Website Audit
Inspect the existing website and repository.
Evaluate:
- Human usability and accessibility
- Important business information available in HTML
- SEO fundamentals
- Metadata and canonical URLs
- Sitemap and robots.txt
- Schema.org structured data
- Services, pricing and FAQs
- Internal linking
- Existing APIs, MCP and WebMCP functionality
```

```
- Existing business information and evidence

Identify missing, incorrect, outdated or inconsistent information.
Do not assume something is missing without checking it.

## Phase 2 — Market Research
Research the business's actual target market.
Identify 5–10 relevant competitors.
For each competitor, investigate:
- Services
- Pricing and pricing models
- Target audience
- Offers and packages
- Service locations
- Languages
- Booking methods
- Relevant differences

Include a source URL and verification date for every finding.
If information cannot be verified, mark it as Unknown.
Do not invent information or make unsupported comparisons.

## Phase 3 — AI Front Door Strategy
Evaluate whether the website needs a dedicated /ai page.
Consider including:
- Business identity
- Business description
- Target audience
- Services
- Service locations
- Pricing
- Offers
- Verifiable evidence
- Reviews
- Booking information
- Relevant website resources
- Last verified date

The page must provide accurate, structured information consistent with the main website.

## Phase 4 — Comparison Page
Evaluate whether a /compare page would provide genuine value.
If appropriate, propose a factual comparison between the business and relevant competitors.
Include sources and dates.
Avoid superiority claims, misleading language, competitor attacks or unsupported conclusions.

## Phase 5 — Developer Documentation & Agent Actions
Inspect existing technical functionality.
Determine whether APIs, MCP, WebMCP or developer documentation would provide genuine value.
Do not introduce unnecessary technical complexity.
Preserve existing functionality and security.
Prioritize read-only functionality and enforce authentication, authorization and confirmation for actions
that modify data.

## Phase 6 — Implementation Plan
Prepare a prioritized implementation plan.
For every proposed change, explain:
```

```
- What needs to change
- Why it matters
- Which users or readers benefit
- Dependencies
- Potential risks
- How to verify the result

## Important Rules
- Research before implementation.
- Do not modify any code during this audit.
- Do not invent business facts.
- Do not fabricate competitor information.
- Do not create contradictory information for AI and human readers.
- Do not make unsupported SEO or AI visibility promises.
- Do not break existing website functionality.
- Preserve the existing design direction and brand identity.
- Ask me questions whenever essential business information is missing.
- Separate verified facts from assumptions and recommendations.

Deliverable: A comprehensive audit, market research report, identified gaps and prioritized implementation
plan.

Stop and wait for my approval before modifying the website.
```

16. Final perspective

The workshop is more than an SEO checklist. Its main opportunity is the combination of understanding the business, understanding the market and making accurate information accessible.

- **Understand the business:** What does it offer, who does it serve and where does it operate?
- **Understand the market:** What are competitors offering, and what are the actual differences?
- **Make information accessible:** Present facts in a way that humans, search engines and AI systems can understand.

The /ai and /compare pages are relatively straightforward to build. The difficult part is getting the information right and keeping it updated.

This document reflects the workshop transcript and screenshot. It does not independently verify the speaker's statistics, technical claims or predictions. Treat the strategy as a framework to test, not as proof of ranking impact.
