SEO & AI Content Implementation Specs

System Prompts, Workflows, & Architecture Rules for Claude Implementation

Overview: This document contains actionable technical directives, content creation frameworks, and architectural principles extracted from expert video analyses. Use these strategies when prompting Claude to generate site content, design page layouts, or execute SEO workflows.

1. AI CONTENT QUALITY & SEMANTIC FRAMEWORK

To avoid penalty risks from low-quality AI auto-generation and ensure search engine optimization, content generated by Claude must strictly adhere to the following workflow standard:

- **Production Time**
- Instant bulk export (< 5 mins)
- **1.0 to 1.5 hours per article** (Includes prompt tuning, curation, research, and formatting).
- **Optimization Goal**
- Dopamine/Volume metric (e.g., 100 low-quality posts/mo)
- **Semantic SEO Optimization** (Deep entity coverage, clear structural hierarchy, entity linking).
- **Publishing Consistency**
- Inconsistent spikes or low-value filler
- Maintain a strict baseline (e.g., 100 high-quality semantic articles per month without drop-off).

Metric / Parameter	Flawed Approach	Required Implementation Standard

> **Rule of Execution:** High-volume publishing works only when content is semantically optimized for target entities and search engine understanding. Uncurated AI text degrades domain quality baselines.

2. LONG-TAIL SEARCH & EDGE CASE ECONOMICS (NEIL PATEL DATA)

Data across 40+ paid and organic search studies demonstrates that long-tail, hyper-specific queries drive high-intent conversions while short broad keywords burn budget.

Search Length	Avg. Conversion Rate	User Psychology & Action Required
1-2 Words	0.17% (< 4% revenue)	Browsing / Top-of-Funnel. High competition, AI overview CTR drop (~61%). Avoid targeting as primary CTA pages.
4 Words	~1.60%	Intent tipping point. Searcher starts defining specific situational constraints.
6+ Words	**1.94% (11x higher)**	High Intent / "Starving Crowd". Drove 51% of tracked revenue. Searcher has ruled out generic solutions.

Finding "Edge Case" High-Intent Queries

Do not rely solely on standard keyword tools (which round low-volume edge cases to 0). Extract high-converting queries from 4 internal sources:

- **Sales Calls:** Track exact questions asked after "What do you do?" (e.g., *"Does this handle tipped employees in 3 states?"*).
- **Support Tickets:** Filter for long-duration tickets where standard documentation failed.
- **Sales Objections:** Convert final friction points into dedicated landing page titles.
- **Google Search Console:** Filter for long-query impressions hitting generic pages; build dedicated pages for them.

> **Opening Rule:** Name the exact edge-case situation in the first sentence of the page (e.g., *"CRM for 12-location dental groups migrating off Dentrix"*). If users must scroll to confirm fit, bounce rates spike.

3. BACKLINK STRATEGY & PROFILE HEALTH (HEYTONY FRAMEWORK)

Avoid common backlink traps that lead to Google manual actions or algorithmic penalties. Focus on quality, relevance, and natural link distribution.

Backlink Myth	Actual Reality	Actionable Standard
Myth 1: Need 1000s of links to rank.	Most Page 1 results have 10–40 high-relevance links. Quality > Volume.	Build ~4 high-relevance contextual links per month. Focus on niche alignment.
Myth 2: Any backlink helps.	Fiverr/PBN links risk explicit penalization and index removal.	Strictly acquire links from reputable, industry-adjacent domains (e.g., health blogs for dentists).
Myth 3: Backlinks work instantly.	Link indexing, crawling, and score adjustments take 1 to 3 months.	Maintain consistent outreach; allow a 60–90 day evaluation window for rank shifts.

Backlink Myth	Actual Reality	Actionable Standard
Myth 4: Only `dofollow` links matter.	100% `dofollow` profiles signal manipulation. `nofollow` drives real traffic.	Maintain a natural ratio of `dofollow` and `nofollow` (PR, news, social citations).

4. SEARCH INTENT & COMPETITOR GAP ANALYSIS

Search intent and deep competitor analysis (Saad Mudassar method) dictate page architecture. Never place product-only purchase grids on informational research queries.

User Query Type	Primary Intent Goal	Required Claude UI / Content Layout
Commercial Research *(e.g., "Best Gaming Laptops")*	Comparison, feature analysis, evaluating options.	• 5 to 10 curated options • Pros and cons lists per option • Decision framework / Buying guide • *Avoid: Plain product grids with zero context*
Transactional / Edge Case *(e.g., "Accounting for Tip Restaurants in Texas")*	Immediate problem resolution, pricing, specialized service.	• Headline stating exact situation • 1 Specific customer proof/case study • Direct scheduling/CTA block

5. LOCAL SEO AUDIT & HIGH-AUTHORITY CITATIONS (MATT DIAMANTE)

Local SEO performance relies heavily on optimizing Google Business Profiles (GBP) and capturing high-authority citation backlinks.

GBP Audit Checklist

- **Primary & Secondary Categories:** Audit competitor profiles to uncover missing secondary service categories.
- **Service List & Descriptions:** Match custom service listings on GBP with exact page titles on the site.
- **Review Velocity & Photo Recency:** Benchmark required photo uploads and review thresholds against top-ranking local competitors.
- **Google Posts:** Maintain weekly updates optimized for target local keywords.

High-Authority Free Citation Strategy (MapQuest Claiming)

MapQuest holds an authority score of **92** with over **45 Million monthly visitors** and provides `dofollow` backlink equity for claimed listings.

1. Go to `MapQuest.com` → Navigate to **Claim Your Business**.
2. Search for your business entity and claim the existing listing (verify phone number and web URL).
3. If unlisted, submit the profile via `BrightLocal.com/citation-builder` to push auto-indexing.

6. BINGEABLE ARCHITECTURE & INFINITE FEEDS (EDWARD STURM FRAMEWORK)

To maximize user dwell time, lower bounce rates, and improve internal page equity flow, structure site content feeds to be high-density and continuous.

Architecture Element	Standard Web Reflex	Bingeable Implementation Standard
Blog / Article Index	Pagination with 5–10 posts per page.	Set archive feed display to **100 posts per page** before pagination to encourage continuous scrolling.
Social & Video Embeds	Static thumbnail grid links out of site.	Embed **infinite-scroll feeds** for YouTube, X, and Instagram directly on resource pages to keep users on-site.

7. COMPLETE MASTER SYSTEM PROMPT FOR CLAUDE

Inject the following prompt into Claude when requesting site copy, landing pages, or local audit workflows:

```
[MASTER SYSTEM PROMPT FOR CLAUDE] Role: Senior Technical SEO & Content Architect Task: Create a semantically optimized, high-intent page for: {{TARGET_KEYWORD_OR_EDGE_CASE}}. Execution Guidelines: 1. EDGE-CASE HEADLINE: Open the content immediately by addressing the specific user situation in Line 1. (e.g., "Looking for [Solution] tailored for [Specific Constraint]..."). 2. INTENT & SITE ARCHITECTURE MATCHING: - If Informational/Commercial: Provide 5-10 detailed options, pros/cons, comparison table, and decision matrix. - If High-Intent Edge Case: Include direct solution details, 1 proof point (metric/screenshot placeholder), and clear primary CTA. - Archive & Listing Pages: Set post density to 100 items per index view for max bingeability and engagement dwell time. 3. LOCAL SEO INTEGRATION (If Location-Specific): - Align site headings with exact GBP primary and secondary categories. - Incorporate local NAP (Name, Address, Phone) markup and suggest relevant high-authority local citations (e.g., MapQuest listing setup). 4. SEMANTIC QUALITY & DEPTH: - Target 6+ word long-tail phrasing and question variants (extracted from sales calls/GSC). - Maintain 1.0-1.5 hr depth standards: no generic fluff, clear H2/H3 hierarchy, paragraph lengths <= 100 words. 5. LINKING & CITATION PRESERVATION: - Maintain clean HTML structure without inline visual clutter. Ensure content reads naturally for both readers and AI search parsers.
```
